

Title: Dogo collar**Abstract**

The first dog collar and leash were found in a stone picture 8000 years ago in Northeastern Saudi Arabia. Currently, dog collars have not advanced very far from ancient history. Our dog collar has many cool features, such as outside padding that has comfortable leather. and inside padding that has the same leather, but even softer, and it has a microchip in the collar that can connect to your phone. In order for our invention to work, we need a technology that can read your pet's mind. We need that because, without it, we cannot understand what your dog and/or cat wants. As you can see, our dog collar has many topics and things to think about. We think that this dog collar should be used in the future because it can take on many tasks at once and is very intelligent, which is why we chose and are making the Doggo collar.

Description

Present technology

The problem is that dog owners have trouble with dog collars. They don't know what their dogs want from time to time, and sometimes a dog is thirsty and hungry. For example, regular collars are made of leather or plastic and can harm dogs due to their simple design.

Most dog collars have no special features or technologies. Though some dog collars still have problems, they choke dogs!

The real problem is that dogs are getting hurt. But there are other effective ways that us humans sometimes hurt dogs. Dog collars are boring. They just have boring pictures, uncomfortable And itchy leather, also, they are very expensive.

Though when we were searching, we found some dog collars with technology they're trying to fix the problem!

History

The first dog collar and leash were found in a stone picture that was drawn 8000 years ago in northeastern Saudi Arabia. In ancient Mesopotamia, they used dog collars for hunting. Ancient Mesopotamians were the ones who invented dog collars. Dog collars for the ancient Mesopotamians looked like cords wrapped around a dog's neck. Around then, dog collars for Egyptians became important. The Egyptians used dog collars by treating dogs as beloved friends; they were also given to the gods as a

sacrifice for favor.

In the late nineteenth century, dog collars were popular from Victorian culture to Europe, all the way to the USA. That trend was caused by interesting items attached to the collars, as well as their culture.

Dog collars have changed over the years, for instance. Dog collars used to be just a chain with interesting items attached to it. Now we have very POP colors, but back in the day that very neutral colors. Now you know, back in the early days, dog collars were not as bright and interesting as nowadays.

Back then, dog collars were just a strap of leather straining the dogs. Like nowadays, dog collars are really colorful, and they just stand out. Back then, they were just light neutral colors. They were a lot different from now. And they also have funky symbols and pictures. And back then, dogs were getting really hurt.

Future technology

Our dog collar has many cool features. like the outside has padding and comfortable leather. And a mini camera on the side. It is even attached to your phone. And you can see what your dog wants, like food or water.

Now it's time to tell you what's inside the collar. There is a tracker inside of the collar and a speaker to translate your dog. And there is a microchip connected to your phone. and a mini fan and inside a mini heater.

In conclusion, this dog collar could help you a lot.it tells you where your dog is all the time, so your dog never gets lost. The microchip tells you if your dog is hungry or thirsty, too! All the time, your dog will be happy if you just buy this fun dog collar! There's a fan, a heater, and so much more. This dog collar helps dog owners and their pet.We also are going to use noninvasive biometric sensors.

Breakthroughs

In order for our invention to work, we need a technology that can read your pet's mind. We need that because without it, we can't understand what a dog and/or cat wants. Like if a dog and/or cat wants food or water, you and the Dogo Collar don't know what your pet wants. Another example is if your pet really wants to go outside, you and the Dogo Collar can't understand what your pet wants or needs. Therefore, without a technology that can understand what your pet wants or needs, the Dogo Collar just wouldn't work as well.

We need a technology that heats up your dog and cools them down. Let's say your dog is on a walk, and it's very hot outside, and you need something to cool them down. You can use the Dogo collar. Another example is you're on a walk, and it's winter, and you need something to heat your dog. With the right technology, the Doggo collar could help you heat up your dog if you wanna slide down or cool your dog down. So with the right technology, we can make the Doggo collar great!

We need a better technology for dog collars, like if your dog is hot and you need to cool it down. Or if you reverse it, then it would if your dog is cold and it needs to be warmed up. Well, we made a dog collar that has those features and more. One of the features is that there is a mini microchip inside. And a fan and a heter.

To cool or warm your dog whenever. The microchip connects to your electronic device. To see if your dog is hungry, thirsty, or whatever it needs. This dog collar has many helpful features.
